

PRESS RELEASE

eMODAT: a multi-platform solution for mobile workflow management

Medium-sized companies and global players profit from excellent usability, compatibility and diversified features

eMODAT is Devacon's answer to the call for a sector-independent, flexible, and cost-efficient workflow management system. The formula of success? The multifunctional application is based on a classic client-server architecture which harmonizes perfectly with all standard mobile terminal devices and interfaces in the market. 'All kinds of companies from all around the globe are looking for a flexible software, which can easily be integrated into existing structures. And none of them wants to be dependent on their smartphones or the systems they come with', explains eMODAT project manager Marcus Heinrich.

First of all, Devacon supplies users with a basic system which comprises all server components for administration, forms and user management. At a later point – when the specific need arises – customers can add individual modules of their choice according to their specific requirements. 'eMODAT is a convenient and cost-efficient starting point for companies to venture out into the world of mobile data capturing. Customers exclusively purchase the packages they will effectively use on a regular basis.' The advantages are obvious: 'Comprehensive full versions tend to jack up the price while most of the customers do not even need all the modules that they eventually pay for.' The Devacon team installs the web-based application at the customer's site. After an introductory training, it is the employees themselves who take care of the system's configuration via the web browser.

Medium-sized company or global player: eMODAT adapts to any need that customers may have. Depending on the size and the field of activity, companies are free to choose individual features to be added to the application as well as the respective licences that they consider indispensable for their work. Field service engineers and hoteliers especially appreciate the Photo module while the healthcare industry is delighted by HL7 Integration into all standard hospital information systems. 'Companies that exclusively work with PDF or Excel files will find that the Data

→ eMODAT is compatible with all standard interfaces in the market.

→ The web-based application contains a classic client-server architecture.

→ Industry-specific modules can easily be added to the basic version.

PRESS RELEASE

Export module is a superfluous luxury for them. Global players working with SAP will definitely think differently, though', elucidates Heinrich.

The opportunity to develop individual elements which go beyond the existing portfolio is a welcome challenge for the team, too. 'When customers approach us with an idea for a special feature, we check whether it may be of interest to other users as well. In this case we standardize the module and bear the majority of the development costs: a win-win situation for both parties.'

About eMODAT:

eMODAT is a development of Devacon GmbH. Since 2006 the IT experts from Ahrensfelde on the outskirts of Berlin have specialized in designing mobile software solutions running on the IT structure of BlackBerry. The flexible web-based data capturing software adapts to the customers' individual requirements regarding the generation of mobile forms – it is even possible to link different questions with customized functions and database-driven blanks. OTA transmission of the collected data guarantees users maximum flexibility and agility.
